

CENSUS OF POPULATION AND HOUSING
SRI LANKA - 1981

HOUSING TABLES
BASED ON A TEN PERCENT SAMPLE

DEPARTMENT OF CENSUS AND STATISTICS
MINISTRY OF PLAN IMPLEMENTATION

PRELIMINARY RELEASE NO 3
JUNE 1982

P R E F A C E

This publication is No. 3 in the series of Preliminary Releases containing information from the Census of Population and Housing taken on 17th March, 1981.

2. This publication contains tables on housing based on a 10% sample tabulation. Tables are included on occupancy, kind of structure, year of construction, number of rooms, principal material of walls, roof and floor, source of drinking water, toilet facilities, type of lighting, cooking fuel used and tenure.

3. Section 1 contains tables giving some basic data for districts while Section 2 contains more detailed tables for the whole country by urban, rural and estate sectors. As in the 1971 Census, the estate sector has been separated from the rural sector since it possess distinctive housing characteristics of its own, which meant separate consideration.

4. It is hoped that this information will meet urgent requirements of data needed for national planning, policy making and other uses.

W.A.A.S. Peiris.

A BRIEF ANALYSIS OF THE 1981 CENSUS DATA ON HOUSING

This note contains a brief analysis of the housing conditions in Sri Lanka based on the 10% sample tables published in this release. The main characteristics of the housing conditions are described indicating changes that have occurred since the Census of 1971.

Increase in the housing stock in relation to population growth

A comparison of the growth of population with the increase in housing stock shows that the increase in housing stock has exceeded the growth of population. In Sri Lanka as a whole population increased by 17.0% between the Censuses of 1971 and 1981 while the number of occupied housing units increased by 26.8%.

The urban sector showed a much higher increase in housing stock (21.0%) compared to a population increase of 12.2%. In the rural sector too the increase in occupied housing units was 33.7% compared to the population increase of (23.1%).

In the estate sector, however, population declined by 17.7% while the number of occupied housing units declined by 8.5%. Hence, an improvement in the housing stock position in relation to population has taken place between 1971 and 1981 in all the sectors.

TABLE A - Growth of Population and Housing by Sectors - 1971 & 1981

Sector	Population			Occupied Housing Units		
	1971	1981	% Increase	1971	1981	% Increase
All Sectors	12,689,897	14,850,001	17.0	2,217,478	2,811,406	26.8
Urban Sector	2,848,116	3,194,879	12.2	421,155	509,459	21.0
Rural Sector	8,707,455	10,721,671	23.1	1,558,765	2,084,496	33.7
Estate Sector	1,134,326	933,451	- 17.7	237,558	217,451	- 8.5

The occupancy rate or the average number of persons per housing unit for Sri Lanka was 5.2 compared to 5.6 in 1971. The urban sector has a higher occupancy rate of 5.4 compared to 5.1 in the rural sector and 4.4 in the estate sector. The occupancy rates in all three sectors show declines since 1971. The urban occupancy rate was 6.2 in 1971 and has dropped to 5.4 in 1981. In

the rural and estate sectors the figures which were 5.6 and 4.8 respectively have dropped to 5.1 and 4.4 respectively in 1981. These declines are probably due to the slightly smaller family sizes consequent to the decline in fertility during the decade 1971-81. The decline in occupancy rates is consistent with the higher increase in housing stock compared to population increase.

Households sharing housing units

The improvement in housing stock position is also reflected by the increase in proportion of units occupied by just one household without any sharing and the decline in the proportion of units shared by 2 or 3 households.

This improvement is evident in all sectors but is greatest in the estate sector and least in the urban sector.

The comparative figures are summarised in Table B below.

TABLE B - Percentage Distribution of Occupied Housing Units by Number of Households Occupying the Unit by Sectors - 1971 and 1981.

Number of Households	All Sectors		Urban Sector		Rural Sector		Estate Sector	
	1971	1981	1971	1981	1971	1981	1971	1981
1	92.4	95.2	91.0	92.5	92.7	95.6	92.5	97.9
2	6.2	4.3	7.0	6.2	6.3	4.0	4.3	1.9
3	0.9	0.5	1.2	1.0	0.7	0.3	2.2	0.1
4 or More	0.5	0.1	0.8	0.3	0.3	0.0	0.9	0.0
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

Type of housing units and their distribution by sectors

Housing units have been classified into three broad types viz. (1) Permanent type (2) Semi-Permanent type and (3) Improvised type on the basis of the principal materials used in the construction of the walls, roof and floor. In general where durable materials such as cement, brick, tile, asbestos sheets etc. have been used in the construction the units have been regarded as belonging to the permanent type. Where walls have been made of cadjan, palmyrah and other non-durable materials, the units have been classified as improvised. Where a mixture of both durable and non-durable materials have been used, they have been regarded as belonging to the semi-permanent type as shown in the detailed scheme

of classification set out in the explanatory note. The rural type of houses with mud walls and cadjan roofs are regarded as belonging to the semi-permanent type. This basis of classification is the same as the one used in the 1971 Census except that the category improvised was called temporary in 1971.

Table C shows the distribution of occupied housing units by type in each sector in both 1971 and 1981. In urban areas the permanent type amounts to 68.0% of all units (compared to 62.9% in 1971). In the rural sector semi-permanent units (mostly with mud walls and cadjan roofs) constitute 56.1% of the units compared to 61.0% in 1971 while 37.2% are of the permanent type compared to 31.6% in 1971. In the estate sector too the semi-permanent type predominates with 75.8% compared to 85.3% in 1971. Although most of the units in the estate sector have walls of brick, cabook or cement and roofs of metal sheets they have floors of mud and hence have been classified as semi-permanent.

TABLE C - Distribution of Occupied Housing Units by Type by Sectors

		1971		1981	
		Number	%	Number	%
All Sectors	Total	2,217,478	100.0	2,811,406	100.0
	Permanent	785,949	35.4	1,173,995	41.8
	Semi-Permanent	1,271,232	57.3	1,457,329	51.8
	Improvised	180,297	7.2	180,078	6.4
Urban Sector	Total	421,155	100.0	509,459	100.0
	Permanent	264,787	62.9	346,623	68.0
	Semi-Permanent	118,368	28.1	124,013	24.3
	Improvised	38,000	9.0	38,820	7.6
Rural Sector	Total	1,558,765	100.0	2,084,496	100.0
	Permanent	492,700	31.6	776,450	37.2
	Semi-Permanent	950,252	61.0	1,168,549	56.1
	Improvised	115,813	7.4	139,496	6.7
Estate Sector	Total	237,558	100.0	217,451	100.0
	Permanent	28,462	12.0	50,922	23.4
	Semi-Permanent	202,612	85.3	164,767	75.8
	Improvised	6,484	2.7	1,762	0.8

In all the three sectors the proportion of permanent type of units has increased between 1971 and 1981 while the proportion of semi-permanent and improvised types have decreased. This reflects an improvement in the type of housing stock.

Materials of Construction

Information relating to materials used in the construction of walls, roof and floor are important from the point of view of permanency of construction and assessment of durability of housing units. Some of the most significant features relating to materials used in the construction of housing units and changes since 1971 are discussed below.

Walls: From the point of view of durability, the material used in the construction of walls may be regarded as the most important item. It is observed that 47.7% of all housing units had their walls constructed of concrete, brick, stone or cabook, compared to 44.5% in 1971 while 43.8% had mud walls compared to 45.9% in 1971. However units having walls made of cadjan or palmyrah accounted for 5.1% compared to 5.0% in 1971. A slight shift towards the use of more durable materials is therefore evident.

As in 1971, in the urban and estate sectors, concrete, brick, stone or cabook was the predominant material used (67.7 in urban and 78.9 in estate sectors) in the construction of walls, while in the rural sector the majority of the housing units (53%) had walls made of mud.

Roof: The most predominant types of roofing material used in the construction were tiles (37.6% compared to 34.5 in 1971) and cadjan, palmyrah or straw (40.2% compared to 40.9% in 1971). Between sectors, there were important differences in the use of roofing materials. In the urban sector, for instance, while housing units with tiled roofs were the most predominant category (48.6% compared to 47.7 in 1971) other materials such as asbestos sheets (15.4% compared to 12.5 in 1971) cadjan, palmyrah or straw (22.1%) and metal sheets (13.2%) were also used. In the rural sector 48.6% (compared to 50.7% in 1971) had roofs made of cadjan, palmyrah or straw and 37.6% (compared to 34.6% in 1971) had tiled roofs. The predominant materials used for roofing in the estate sector was metal sheets (71.5% compared to 73.9% in 1971). Thus in both urban and rural areas there has been an increasing use of tiles. Asbestos sheets are also being used to a greater extent in urban areas.

Floor: For the country as a whole, housing units with cement floors constituted 49.5% compared to 44.1% in 1971 while those having floors made of mud or earth accounted for 49.7% compared to 55% in 1971. A shift from mud or earth to cement is clearly evident. While cement was the more predominant type of material used for floors in the urban sector (80.2% compared to 78.6% in 1971) the majority of housing units in the rural and estate sectors had floors made of mud (54.6% in the rural sector compared to 59.5% in 1971 and 75.1% in the estate sector compared to 86.4% in 1971).

Number of rooms

For the purpose of the Census, living rooms, sitting rooms, dining rooms, bedrooms, servants' rooms etc. were counted as rooms while kitchens, pantries, bathrooms, store rooms etc. were excluded. The average number of rooms per housing unit was 2.47 for the country as a whole compared to 2.24 in 1971. Although there was no significant difference in this average as between the urban and rural sectors, housing units in the estate sector were found to be comparatively smaller in size with an average of only 1.71 rooms (compared to 1.44 in 1971) per unit. Permanent housing units generally had the higher average number of rooms compared to the other types in all three sectors.

The distribution of housing units by number of rooms for the different sectors is summarised in Table D below.

TABLE D - Percentage Distribution of Occupied Housing Units by
Number of Rooms by Sectors - 1981

No. of Rooms	All Sectors	Urban Sector	Rural Sector	Estate Sector
1	30.8	30.8	28.0	56.8
2	32.3	29.2	33.3	29.6
3	17.8	18.4	18.7	7.7
4	9.9	10.6	10.5	3.1
5	4.8	5.5	5.0	1.1
5 or more	4.4	5.5	4.5	1.7
Total	100.0	100.0	100.0	100.0
Average number of rooms	2.47	2.59	2.52	1.71

A little under a third of the housing units consisted of one roomed houses. In the estate sector, however, such units accounted for as much as 56.8% of the total. The vast majority of the housing units (about 80%) had one to three rooms inclusive.

Source of water for drinking

Supply of water through pipes is considered to be the most effective way of protecting it from pollution and ensuring its purity. One of the ways of ensuring public health is by the provision of piped water to the bulk of the community. Besides this, the availability of piped water is considered perhaps the most valuable indicator of sanitary conditions particularly in built up urban areas.

In the 1981 Census the question on source of water supply specifically referred to drinking water while in 1971 the question merely referred to water supply with nospecification of purpose for which the water was used. Despite this difference the 1981 Census data might still be broadly comparable with the 1971 Census data in some respects.

TABLE E - Percentage Distribution of Occupied Housing Units by Source of Water Supply by Sectors - 1971 and 1981

Source	All Sectors		Urban Sector		Rural Sector		Estate Sector	
	1971	1981	1971	1981	1971	1981	1971	1981
Piped water on tap	20.1	17.3	45.3	46.5	4.8	5.1	74.7	65.6
Well	68.8	73.1	50.5	48.7	81.9	84.5	15.4	20.4
River, Tank or other source	8.9	7.0	2.0	1.1	11.0	8.5	7.3	5.8
Not Stated	2.3	2.7	2.1	3.7	2.3	1.9	2.1	8.1
Total	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0

It is observed that in urban and rural areas the percentage of units having access to piped water of any sort has risen slightly in 1981 but the estate sector shows a drop from 74.7% in 1971 to 65.6% in 1981. As a result the percentage of units with piped water has declined for the country as a whole. The vast majority of the housing units (73.1%) obtain their water from wells. The percentage of units using well water has risen between 1971 and 1981. Seven percent of all units (compared to 8.9 in 1971) depend on other sources such as rivers, streams, tanks, etc. for their drinking water.

The principal source of drinking water in rural areas is the well with 84.5% (compared to 81.9% in 1971) of all housing units drawing their water from this source. In the urban areas, too, this is the chief source but the corresponding proportion of housing units depending on water from well is only 48.7% compared to 50.5% in 1971. Although 46.5% of the housing units in the urban sector have access to piped water on tap the proportion with water supply installation inside the premises is 24.4% while 22.1% get their water from a tap outside the premises.

TABLE F - Percentage Distribution of Housing Units by Main Source of Drinking Water by Type and Location - 1981

Source	All Sectors	Urban Sector	Rural Sector	Estate Sector
Piped Water on Tap				
Within Premises	8.0	24.4	19.8	28.8
Outside Premises	9.3	22.1	3.3	36.8
Protected Well				
Within Premises	25.8	27.7	26.7	12.6
Outside Premises	26.5	16.1	31.4	3.7
Unprotected Well	20.8	4.9	26.4	4.1
River, Tank or Other Source	7.0	1.1	8.5	5.8
Not Stated	2.7	3.7	1.9	8.1
Total	100.0	100.0	100.0	100.0

Colombo district is in the most advantageous position with respect to water supply with 31.1% of housing units having piped water within their premises while another 19.4% have access to piped water outside the premises. Hence on the whole 50.5% of the housing units have access to water on tap.

Although Nuwara Eliya district has a higher overall percentage (65.1%) of units with access to piped water only 19.2% have the tap within the premises. Other districts with at least a quarter of the housing units having access to piped water are Badulla (43.5%), Kandy (28.9%) and Matale (27.1%). These are the districts with large estate sectors.

Toilet Facilities

The position with regard to toilet facilities shows an improvement with 53.0% of all units having toilets for exclusive use compared to 45.5% in 1971. The urban and rural sectors also show improvements in this respect while the estate sector shows a slight decline in the percentages of units with toilets for exclusive use to 18.4% from 20.5% in 1971.

The percentage of units not having a toilet meant for the use of the unit (including the not stated category) also shows a slight decline for Sri Lanka as a whole as well as the urban and rural sectors but shows an increase in the estate sector from 15.6% in 1971 to 36.6 in 1981.

TABLE G - Percentage Distribution of Housing Units by Toilet Facilities by Sectors - 1971 and 1981

Sector	Total	Toilet for Exclusive Use		Shared Toilet		No Toilet (Including not Stated)	
		1971	1981	1971	1981	1971	1981
All Sectors	100.0	45.5	53.0	19.0	13.6	35.5	33.4
Urban Sector	100.0	48.9	56.8	30.7	23.5	20.4	19.8
Rural Sector	100.0	48.5	55.5	9.0	7.9	42.5	36.5
Estate Sector	100.0	20.5	18.4	63.9	45.1	15.6	36.6

This increase is probably due to the slightly different concept adopted in the 1981 Census with regard to the availability of a toilet and not an indication of any real deterioration in the position. In the 1971 Census the question on toilet referred to the one mostly used by the occupants of the housing unit. The 1981 Census question asked about the toilet available for the unit, either for exclusive use or meant to be shared. If there was no toilet meant for the unit and the occupants used that of another unit or a public toilet the entry with regard to toilet was to be 'none'. It is therefore likely that in the estate sector where only about a fifth of all units have exclusive toilets, many units sharing a common toilet may have reported 'none' and this would have given rise to an upward bias in the number of units with no toilets. The urban and rural sectors too may also have been affected to a slight extent but inspite of this the situation shows an improvement.

From Table H which shows the distribution of the type of toilet available for the housing units it can be seen that the water seal type predominated

in urban areas while the pit type predominated in rural and estate areas. The percentage share of the bucket type toilets which was already low in 1971 has declined further in 1981.

In urban areas as a whole the flush type of toilet has declined from 22.8% in 1971 to 15.6% in 1981 while the water seal type has increased substantially from 19.2% in 1971 to 38.9% in 1981. Cost of equipment for flush type of toilets may be a factor responsible for the decline but only a more detailed analysis of the data by districts and towns can help in identifying the areas and factors affecting the change.

TABLE H - Percentage Distribution of Occupied Housing Units by Type of Toilet by Sectors - 1971 and 1981

Type of Toilet	All Sectors		Urban Sector		Rural Sector		Estate Sector	
	1971	1981	1971	1981	1971	1981	1971	1981
Flush toilet	6.7	4.8	22.8	15.6	2.2	2.1	8.2	4.9
Water Seal	14.3	21.9	19.2	38.9	9.9	17.5	33.9	24.2

Districts with a very high proportion of housing units without toilets of any kind are Mullaitivu (81.4% without any toilet), Batticaloa (80.2%), Vavuniya (74.9%), Mannar (72.3%), Amparai (64.5%) and Trincomalee (62.4%).

Type of lighting

A large majority (82.4%) of housing units in Sri Lanka still continue to depend on kerosene for lighting, although the proportion has declined from 89.4% in 1971. The proportion of units using electricity has increased from 9.0% in 1971 to 14.9% in 1981. Even in the urban sector, only 34.5% of all units had electricity in 1971 while in 1981 it has risen to 45.9%. In the rural and estate sectors the percentages of units with electricity are low (8.3% in rural and 5.6% in estates) but show improvements over the 1971 figures (2.8% and 4.1% respectively). Among the permanent units 65.5% in the urban sector (compared to 52.1% in 1971) have electricity while for the island as a whole the proportion is 34.0% compared

to 23.5% in 1971. Thus, considerable progress in electrification for lighting of housing units has taken place in both urban and rural areas.

As would be expected the number of semi-permanent and improvised housing units that use electricity is negligible.

Colombo has the highest percentage with 43.7% of the housing units using electricity for lighting. Other districts with more than 15% of the units having electric lights are Jaffna (25.4%), Gampaha (21.6%), Kalutara (18.0%) and Kandy (17.7%).

All other districts have less than 15% of the housing units using electricity with Vavuniya having the smallest percentage (3.3%).

Principal cooking fuel

It is observed that firewood is the predominant fuel used for cooking with 94.1% of all housing units using it. Next comes Kerosene with 2.3%. In urban areas the use of firewood is less prevalent than in rural areas with 85.4% while kerosene is used in 5.4% of the housing units.

Tenure

The extent to which households own or rent the housing units they occupy is of special significance for housing and rent policy, as well as for the formulation of housing programmes. Information on tenure status was obtained under four main categories viz. owner occupied, rented, rent free and other forms of tenure.

It is seen that 69.4% (compared to 63.3% in 1971) of all housing units in Sri Lanka are owner-occupied, 10.1% (compared to 12.4% in 1971) are rented or leased and 11.6% (compared to 15.1% in 1971) are free of rent. In urban areas owner occupied houses comprised 57.3% (compared to 47.7% in 1971) while rented houses amounted to 28.6% compared to 41.0% in 1971.

This considerable decrease in the proportion of rented houses and increase in ownership is the result of legislation which has enabled many tenants to become owners of the houses they were living in as tenants. The large majority of the housing units in the rural sector (79.5% compared to 76.9% in 1971) were owner-occupied, while in the estate areas, rent free houses constituted as much as 79% compared to 88.7% in 1971.

TABLE I - Percentage Distribution of Occupied Housing Units by
Tenure by Sector - 1971 and 1981.

Tenure	All Sectors		Urban Sector		Rural Sector		Estate Sector

EXPLANATORY NOTES

The 1981 Housing Census was taken along with the Population Census in March 1981. The relevant information on housing was collected during the Preliminary Census i.e. 1st - 10th March, 1981.

In all urban areas, namely, Municipal, Urban and Town Council areas, the information on housing was obtained in respect of all housing units and living quarters other than housing units. In rural and estate areas, however, this information was collected from only a 10% sample of the census blocks (enumerator's area) in each district. The sample of census blocks was selected on a systematic basis from each of the rural and estate sectors in each district. Within a selected sample census block, however, all housing units and living quarters other than housing units were covered.

Although there was complete coverage of the housing units in the urban sector, a 10% sample of urban census blocks was chosen for advance tabulation and the tables included in this publication are based on the housing census returns obtained from a 10% sample of census blocks in the whole country. The sample of blocks is the same as that on which the 10% sample tables on population published in Preliminary Release No. 2 are based. However, the numbers as shown in the tables are inflated figures which provide estimates of what the actual numbers would have been if the tables were based on a complete enumeration.

Definition of Housing Unit

A housing unit was defined as a place of residence (a) which is separate from other places of residence and (b) which has independent access.

Under this definition any building or part of a building or any structure whether permanent or temporary such as huts, shanties, sheds etc., which are in fact used as places of residence were regarded as housing units.

Number of Rooms

In determining the number of rooms in the housing unit all rooms used for living purposes such as living rooms, bedrooms, dining rooms, servants' rooms, were included but kitchens, store-rooms, bathrooms, balconies and open verandahs were excluded.

Tenure

The tenure of a housing unit is regarded as owned if the owner lives in the unit although he need not be the head of the household.

Classification of Housing Units into Permanent, Semi-Permanent and Improvised Types.

The classification was made on the basis of the principal materials used in the construction of the walls, roof and floor. In general, where the materials used were of the durable type like brick, cement, tile, asbestos sheets etc. the units were classified as permanent. Where the walls and roof were made of cadjan, palmyrah or other inferior or non-durable material the units have been classified as improvised. Where a mixture of durable and non-durable materials have been used the units have been generally classified as semi-permanent. The following table shows the detailed scheme of classification. The same basis of classification was used in the 1971 Census too.

BASIS OF CLASSIFICATION OF HOUSING UNITS INTO PERMANENT, SEMI-PERMANENT AND IMPROVISED TYPES

<u>Material of Wall</u>	<u>Material of Roof</u>	<u>Material of ^{Floor} Roof</u>	<u>Type of Housing Unit</u>
1. Cement blocks, stone, bricks or cabook	Tile, asbestos or metal sheets	Cement or wood	Permanent
2. - do -	- do -	Mud	Semi-Permanent
3. - do -	Cadjan or palmyrah	Cement, wood or mud	Semi-Permanent
4. Mud	Tile, asbestos or metal sheets	Cement	Permanent
5. - do -	- do -	Wood or mud	Semi-Permanent
6. - do -	Cadjan or palmyrah or straw	Cement, wood or mud	Semi-Permanent
7. Wood	Tile, asbestos or metal sheets	Cement, wood or mud	Semi-Permanent
8. - do -	Cadjan or palmyrah or straw	Cement	Semi-Permanent
9. - do -	- do -	Wood or mud	Improvised
10. Cadjan, palmyrah or straw	Any material	Any material	Improvised

Discrepancy Due to Inflation and Rounding of Figures:

The sum of the figures in any column or row of the tables may differ slightly from the total as shown. As these figures are estimates which cannot be regarded as accurate upto the last digit, these small differences should not cause any inconvenience in the use and interpretation of the tables.

Preface	
A Brief Analysis of the 1981 Census Data on Housing.	3
Explanatory Notes.	14
 SECTION I - Tables Showing Data for Districts. 	
Table No.	
1 Housing units by type and whether occupied or vacant for districts.	17
2 Occupied housing units by type and number of households for districts.	21
3 Occupied housing units by type and year of construction for districts.	25
4 Occupied housing units by type and main source of drinking water.	29
5 Occupied housing units by type and toilet facilities.	33
6 Occupied housing units by type and principal type of lighting.	37
7 Occupied housing units by type and principal cooking fuel.	41
8 Occupied housing units by type and tenure.	45
9 Occupied housing units by type and number of rooms.	49
 SECTION II - All Island Tables. 	
10 Occupied housing units by type and number of households.	53
11 Occupied housing units by type and number of occupants.	54
12 Occupied housing units by type and kind of structure.	57
13 Persons in occupied housing units by type and kind of structure.	58
14 Occupied housing units by type and year of construction	59
14A Occupied housing units by type and year of construction - percentages.	60
15 Occupied housing units by type and number of rooms.	61
15A Occupied housing units by type and number of rooms - percentages.	62
